A Complexity Dichotomy for Finding Disjoint Solutions of Vertex Deletion Problems

Michael R. Fellows¹, Jiong Guo², <u>Hannes Moser</u>², and Rolf Niedermeier²

¹ University of Newcastle, Australia

² Friedrich-Schiller-Universität Jena, Germany

MFCS 2009

Starting Example

Vertex Bipartization

Input: An undirected graph G = (V, E) and a parameter $k \ge 0$.

Question: Can we find a vertex set $X \subseteq V$, $|X| \le k$, such that $G[V \setminus X]$ contains no odd-length cycle?

Starting Example

Vertex Bipartization

Input: An undirected graph G = (V, E) and a parameter $k \ge 0$.

Question: Can we find a vertex set $X \subseteq V$, $|X| \le k$, such that $G[V \setminus X]$ contains no odd-length cycle?

Starting Example

Vertex Bipartization

Input: An undirected graph G = (V, E) and a parameter $k \ge 0$. Question: Can we find a vertex set $X \subseteq V$, $|X| \le k$, such

that $G[V \setminus X]$ contains no odd-length cycle?

Starting Example

Vertex Bipartization

Input: An undirected graph G = (V, E) and a parameter $k \ge 0$. Question: Can we find a vertex set $X \subseteq V$, $|X| \le k$, such

that $G[V \setminus X]$ contains no odd-length cycle?

Example

Theorem: Vertex Bipartization is NP-complete

Fixed-Parameter Tractability

Fixed-Parameter Tractability

A parameterized problem with input instance (G, k) is *fixed-parameter tractable* with respect to parameter k if it can be solved in $f(k) \cdot poly(|G|)$ time.

Fixed-Parameter Tractability

Fixed-Parameter Tractability

A parameterized problem with input instance (G, k) is *fixed-parameter tractable* with respect to parameter k if it can be solved in $f(k) \cdot poly(|G|)$ time.

Theorem

Vertex Bipartization can be solved in $O(3^k \cdot mn)$ time.

[Reed, Smith, and Vetta, Operations Research Letters 32, 2004]
[Hüffner, Journal of Graph Algorithms and Applications 13, 2009]
[Lokshtanov, Saurabh, and Sikdar, IWOCA 2009]

Some Applications of Iterative Compression

- Undirected Feedback Vertex Set in O(5^k · kn²) time
 [Chen et al., Journal of Computer and System Sciences 74, 2008]
- Directed Feedback Vertex Set in O(k! · 4^k · k³n⁴) time [Chen et al., Journal of the ACM 55, 2008]
- ▶ Directed Feedback Vertex Set in Tournaments in O(2^k · n²(log log n + k)) time [Dom et al., CIAC 2006]
- Signed Graph Balancing in O(2^k · m²) time
 [Hüffner, Betzler, and Niedermeier, Journal of Combinatorial Optimization, 2009]
- Chordal Deletion is FPT [Marx, Algorithmica, 2009]
- Cluster Vertex Deletion in O(2^k · k⁶ log k + nm) time [Hüffner et al., Theory of Computing Systems, 2009]

• Almost 2-Sat in $O(15^k \cdot km^3)$ time

[Razgon and O'Sullivan, Journal of Computer and System Sciences, 2009]

Iterative Compression: Example

Vertex Cover

- Input: An undirected graph G = (V, E) and a parameter $k \ge 0$.
- Question: Can we find a vertex set $X \subseteq V$, $|X| \le k$, such that each edge has a least one endpoint in X?

Iterative Compression: Example

Vertex Cover

- Input: An undirected graph G = (V, E) and a parameter $k \ge 0$.
- Question: Can we find a vertex set $X \subseteq V$, $|X| \le k$, such that each edge has a least one endpoint in X?

Iterative Compression Framework

Idea

Use a *compression routine* iteratively: Given a solution of size k + 1 for a graph *G*, compute a solution of smallest size for *G*.

[Reed, Smith, and Vetta, Operations Research Letters 32, 2004]

Iterative Compression Framework

Idea

Use a *compression routine* iteratively: Given a solution of size k + 1 for a graph G, compute a solution of smallest size for G.

[Reed, Smith, and Vetta, Operations Research Letters 32, 2004]

Iterative Compression Framework

- 1. Start with an empty vertex set V' and an empty solution X.
- 2. For each vertex v in V(G):
 - 2.1 Add v to V' and to X.
 - 2.2 Use the compression routine to compress the solution X for G[V'].
 - 2.3 If |X| > k, then return "no-instance".

Iterative Compression Framework

Idea

Use a compression routine iteratively: Given a solution of size k + 1 for a graph G, compute a solution of smallest size for G.

[Reed, Smith, and Vetta, Operations Research Letters 32, 2004]

Iterative Compression Framework

- 1. Start with an empty vertex set V' and an empty solution X.
- 2. For each vertex v in V(G):
 - 2.1 Add v to V' and to X.
 - 2.2 Use the compression routine to compress the solution X for G[V'].
 - 2.3 If |X| > k, then return "no-instance".

Invariant during the loop for a yes-instance:

After the compression, X is a solution of size at most k for the current graph G[V'].

Task

Given a solution X of size k + 1, compute a smallest solution X'.

Compression Routine (1)

Task

Given a solution X of size k + 1, compute a smallest solution X'.

Approach

Try all $2^{|X|}$ partitions of X into a part to exchange (S) and a part to keep $(X \setminus S)$.

Compression Routine (1)

Task

Given a solution X of size k + 1, compute a smallest solution X'.

Approach

Try all $2^{|X|}$ partitions of X into a part to exchange (S) and a part to keep $(X \setminus S)$.

Compression Routine (1)

Task

Given a solution X of size k + 1, compute a smallest solution X'.

Approach

Try all $2^{|X|}$ partitions of X into a part to exchange (S) and a part to keep $(X \setminus S)$.

Compression Routines for Known Applications

- Vertex Bipartization brute force: O(2^k · km) time
- Undirected Feedback Vertex Set bounded search tree: O(4^k · n²) time
- ► Cluster Vertex Deletion reduction to the polynomial-time solvable Weighted Maximum Matching problem: O(m√n log n) time
- Directed Feedback Vertex Set brute force combined with bounded search tree: O(k!4^k · k²n³) time
- Directed Feedback Vertex Set in tournaments reduction to the polynomial-time solvable Longest Common Subsequence problem: O(n(log log n + k)) time

Introduction Iterative Compression Framework Vertex Deletion Problems and Iterative Compression NP-Hardness Proof Outlook

Vertex Deletion Problems

A graph property Π is a (possibly infinite) set of graphs.

 Π Vertex Deletion

Input: An undirected graph G = (V, E) and a parameter $k \ge 0$.

Question: Can we find a vertex set $X \subseteq V$, $|X| \leq k$, such that $G[V \setminus X] \in \Pi$?

Examples

problem	graph property Π
Vertex Cover	set of all graphs without edges
Feedback Vertex Set	set of all forests (acyclic graphs)
Vertex Bipartization	set of all bipartite graphs
Cluster Vertex Deletion	set of all cluster graphs ¹

¹Graphs whose connected components are cliques.

Compression Task for Vertex Deletion Problems

Disjoint Π Vertex Deletion

Input: An undirected graph G = (V, E) and a vertex subset $S \subseteq V$ such that $G[V \setminus S] \in \Pi$.

Question: Can we find a vertex set $S' \subseteq V$, such that $S' \cap S = \emptyset$, |S'| < |S| and $G[V \setminus S'] \in \Pi$?

We restrict our attention to graph properties such that

- ▶ for all $V' \subseteq V$, $G \in \Pi \Rightarrow G[V'] \in \Pi$ (Π is hereditary)
- If every connected component of a graph is in Π, then the graph is in Π (Π is determined by the components)

(All the problems on undirected graphs mentioned before are based on such properties.)

Forbidden Induced Subgraph Characterization

For any hereditary graph property Π there exists a set \mathcal{H}_{Π} of inclusion-minimal forbidden induced subgraphs for $\Pi.$

[Greenwell, Hemminger, and Klerlein, 1973]

Introduction Iterative Compression Framework Vertex Deletion Problems and Iterative Compression NP-Hardness Proof Outlook

Complexity Dichotomy for the Compression Task

Main Theorem

Disjoint Π Vertex Deletion is NP-hard unless the set \mathcal{H}_{Π} of forbidden induced subgraphs corresponding to Π contains a single edge or a path of length two—in these cases it is polynomial-time solvable.

reduction to Maximum Matching + size limit 4

NP-Hardness: Basic Reduction Scheme

Let *H* be a "properly chosen" graph from \mathcal{H}_{Π} .

NP-Hardness: Basic Reduction Scheme

Let *H* be a "properly chosen" graph from \mathcal{H}_{Π} .

[Lewis and Yannakakis, Journal of Computer and System Sciences 20, 1980]

Vertex Cover instance

Disjoint Π Vertex Deletion instance

NP-Hardness: Basic Reduction Scheme

Let *H* be a "properly chosen" graph from \mathcal{H}_{Π} .

[Lewis and Yannakakis, Journal of Computer and System Sciences 20, 1980]

Vertex Cover instance

Disjoint Π Vertex Deletion instance

NP-Hardness: Basic Reduction Scheme

Let *H* be a "properly chosen" graph from \mathcal{H}_{Π} .

NP-Hardness: Basic Reduction Scheme

Let *H* be a "properly chosen" graph from \mathcal{H}_{Π} .

NP-Hardness: Basic Reduction Scheme

Let *H* be a "properly chosen" graph from \mathcal{H}_{Π} .

Observation

For the reduction scheme to work, the old solution S must not contain vertices corresponding to vertices in the Vertex Cover instance, but it has to obstruct all forbidden induced subgraphs in \mathcal{H}_{Π} .

Cases

- All graphs in \mathcal{H}_{Π} contain a K_3 (\checkmark).
 - \Rightarrow reduce from Vertex Cover on K_3 -free graphs

Observation

For the reduction scheme to work, the old solution S must not contain vertices corresponding to vertices in the Vertex Cover instance, but it has to obstruct all forbidden induced subgraphs in \mathcal{H}_{Π} .

Cases

- All graphs in H_{II} contain a K₃ (→).
 ⇒ reduce from Vertex Cover on K₃-free graphs
- ► \mathcal{H}_{Π} contains no stars (\checkmark). ⇒ reduce from Vertex Cover on K_3 -free graphs, where H is a "properly chosen" graph among all K_3 -free graphs in \mathcal{H}_{Π}

Observation

For the reduction scheme to work, the old solution S must not contain vertices corresponding to vertices in the Vertex Cover instance, but it has to obstruct all forbidden induced subgraphs in \mathcal{H}_{Π} .

Cases

- All graphs in \mathcal{H}_{Π} contain a K_3 (\checkmark).
 - \Rightarrow reduce from Vertex Cover on K_3 -free graphs
- *H*_{II} contains no stars (♥♥).
 ⇒ reduce from Vertex Cover on *K*₃-free graphs, where *H* is a "properly chosen" graph among all *K*₃-free graphs in *H*_{II}
- ► H_{II} contains a star. Reduction scheme does not seem to work...

Reduction for Large Stars

 \mathcal{H}_{Π} contains a star with at least four leaves \Rightarrow reduction from Vertex Cover on graphs of maximum degree three.

Reduction for Large Stars

 \mathcal{H}_{Π} contains a star with at least four leaves \Rightarrow reduction from Vertex Cover on graphs of maximum degree three.

Reduction for Large Stars

 \mathcal{H}_{Π} contains a star with at least four leaves \Rightarrow reduction from Vertex Cover on graphs of maximum degree three.

Does not work for stars with three leaves (\checkmark)...
